PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

DETAILED ACTION***Response to Amendment***

Applicant's arguments with respect to claims 9, 11-13, 37, 40-44 based on the Response filed on 03/7/2008 have been considered but are moot in view of the new ground(s) of rejection. Therefore, this is Final action.

Claims 1-8, 10, 14-36 are cancelled.

In last responses filed on 03/07/2008, 03/26/2007 and 11/20/2006 the features of “the first particle beam treatment” and “second particle beam treatment” cause the confusion between the following two interpretations:

(1) The treatment with first particle beam and the treatment with second particle beam, wherein the first particle is different from the second particle. In the last office actions, examiner mentioned that there is no disclosure for two different particles in the treatments in different directions. Therefore, the interpretation of “two different particles in the treatments in different directions” is not correct.

(2) “the first particle beam treatment” is **first treatment with particle beam** and “second particle beam treatment” is **second treatment with particle beam**, wherein the first treatment and second treatment are in different direction with same particle beam.

In order to clarify the subject matter rejection, examiner interprets “the first particle beam treatment” and “second particle beam treatment” in claims 9 and

Art Unit: 2871

37 as “the first treatment of particle beam” and “the second treatment of particle beam”. Therefore, the first treatment and the second treatment in different directions may use the same (or single) particle/ion beam.

Callergari et al. disclose (col. 6 lines 12-31);

Referring to FIG. 9, there is provided an atomic beam alignment device 948 for aligning an atomic structure of an alignment film (e.g., hydrogenated DLG film) in at least one desired direction or orientation through the use of ion radiation. As is generally understood the alignment film serves to orient the direction of the liquid-crystal. That is, when a liquid cell is formed, the molecules of the liquid-crystal align along the direction(s) provided by the atomic structure of the alignment films. Accordingly, atomic beam 948 can be used to radiate ions at the alignment film to disturb (i.e., to break bonds) and align the atomic structure of the alignment film in a desired direction or orientation, such as in a horizontal, unidirectional or multidirectional manner. A mask with features etched into it can also be used to selectively align a local area, thus leading to the fabrication of domains of alignment. These can then be used to fabricate a multidomain display, which has vastly superior viewing attributes. For multidirectional alignment, it is preferred that the multidirections are selected in such a fashion that results in a multidomain device.

Atomic beam radiate ions in multidirectional manner; therefore, same particles/ions radiate in different directions (multidirectional manner). In the multidirectional alignment, the multidirections of particle beam treatments must be selected in such a fashion of particle beam treatments respectively that results in a multidomain device. Therefore, **a first particle beam treatment (one fashion in one direction) and a second particle beam treatment (another fashion in another direction) selectively align the domains in first and second direction respectively; thus a direction (fashion) of said first particle beam treatment with respect to said dry deposited layers is different than a direction (fashion) of said second particle beam treatment with respect to said dry deposited layers.**

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 9, 11-13 and 37 are rejected under 35 U.S.C. 103(a) as being unpatentable over Oh et al. (US6665036B2) in view of Kim et al. (US006111627A), Hiroshi (US5995186A), and Callegari et al. (US6061114A).

In regard to claims 9 and 37, Oh et al. teach (Fig. 3A-B) a multi-domain liquid crystal display comprising

- a bottom substrate 210 having a first surface;
- a transparent conductive layer (data electrodes 208 and common electrode 209, thin film transistors and other display circuitry in bottom substrate to form the in-plane switching mode) disposed over said first surface of said bottom substrate.
- a top substrate 211 having a second surface;
- a color filter layer (color filter 229) disposed over a surface of the top substrate;
- a transparent conductive layer 118 disposed over said color filter;
- a first alignment layer 223a over said first transparent conductive layer

Art Unit: 2871

- a second alignment layer 223b made of over said second surface; said second alignment layer being spaced adjacent to and facing said first alignment layer;
- a liquid crystal material 230 disposed in the space therebetween;

wherein

However, Oh et al. fail to disclose

(a) a second transparent conductive layer disposed over the color filter;

(b) a plurality of uniformly sized spacer 108 distributing within said space;

(c) the alignment layers made of the dry deposited layers, which are made of material selected from the group consisting of hydrogenated diamond-like carbon, amorphous hydrogenated silicon, silicon carbide (SiC), silicon dioxide (SiO₂), glass, silicon nitride (Si₃N₄), alumina (Al₂O₃), cerium(IV) oxide (CeO₂), tin oxide (SnO₂), zinc titanate (ZnTiO₂) and a combination thereof;

(d) each of said first alignment layer and said second alignment layer made of the dry deposited layers is divided into a plurality of pixels each having a boundary and at least two domains; wherein said domains are aligned by a mechanical mask; said dry deposited layers are exposed to at least a first particle (ion) beam treatment and a second particle (ion) beam treatment, where a first particle beam and a second particle beam use the same ion, which is selected from the group consisting argon, nitrogen, oxygen and a mixture thereof; and a direction of said first particle beam treatment with respect to said dry deposited layer is different than a direction of said second particle beam treatment with respect to said dry deposited layer.

Kim et al. teach (Fig.4) (a) a second transparent conductive layer disposed over the color filter, which is formed on the surface of upper substrate; this second transparent conductive layer used for preventing electrostatics forming on the upper substrate (col. 3 lines 1-3). Kim also discloses the alignment layers 44 and 28.

Hiroshi teaches (Fig. 5) (b) a plurality of uniformly sized spacer 108 distributing within said space for supporting the thickness of liquid crystal layer (col. 5 lines 25-29).

Callegari et al. teach

(c) the alignment layers made of the dry deposited layers, which are made of material selected from the group consisting of hydrogenated diamond-like carbon, amorphous hydrogenated silicon, silicon carbide (SiC), silicon dioxide (SiO₂), glass, silicon nitride (Si₃N₄), alumina (Al₂O₃), cerium(IV) oxide (CeO₂), tin oxide (SnO₂), zinc titanate (ZnTiO₂) and a combination thereof for requiring fewer steps and less cost to manufacture (col. 3 lines 51-58);

(d) each of said first alignment layer and said second alignment layer made of the dry deposited layers is divided into a plurality of pixels each having a boundary and at least two domains; wherein each of said multi-domain, dry deposited layers is obtained by a mechanical mask 966; said dry deposited layers are exposed to at least a first particle (ion) beam and a second particle (ion) beam, where a first particle beam treatment and a second particle beam treatment use the same ion, which is selected from the group consisting argon,

Art Unit: 2871

nitrogen, oxygen and a mixture thereof; and a direction of said first particle beam treatment with respect to said dry deposited layer is different than a direction of said second particle beam treatment with respect to said dry deposited layer with the features of claim 11; thus **deposited layers (alignment layers) are exposed to at least a first particle treatment and a second particle treatment to selectively align said domains in first direction (first fashion) and second direction (second fashion) respectively** for resulting multidomain device so that attributing large view angle (col. 6 lines 19-31).

Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to further modify a multi-domain liquid crystal display as Oh et al. disclosed with (a) a second transparent conductive layer disposed over the color filter, which is formed on the surface of upper substrate; this second transparent conductive layer used for preventing electrostatics forming on the upper substrate (col. 3 lines 1-3) as taught by Kim et al.; (b) a plurality of uniformly sized spacer 108 distributing within said space for supporting the thickness of liquid crystal layer (col. 5 lines 25-29) as taught by Hiroshi; (c) the alignment layers made of the dry deposited layers, which are made of material selected from the group consisting of hydrogenated diamond-like carbon, amorphous hydrogenated silicon, silicon carbide (SiC), silicon dioxide (SiO₂), glass, silicon nitride (Si₃N₄), alumina (Al₂O₃), cerium(IV) oxide (CeO₂), tin oxide (SnO₂), zinc titanate (ZnTiO₂) and a combination thereof for requiring fewer steps and less cost to manufacture (col. 3 lines 51-58); (d) each

Art Unit: 2871

of said first alignment layer and said second alignment layer made of the dry deposited layers is divided into a plurality of pixels each having a boundary and at least two domains; wherein each of said multi-domain, dry deposited layers is obtained by a mechanical mask 966; said dry deposited layers are exposed to at least a first particle (ion) beam and a second particle (ion) beam, where a first particle beam treatment and a second particle beam treatment use the same ion, which is selected from the group consisting argon, nitrogen, oxygen and a mixture thereof; and a direction of said first particle beam treatment with respect to said dry deposited layer is different than a direction of said second particle treatment beam for resulting multidomain device so that attributing large view angle (col. 6 lines 19-31) with (1) non-contact alignment, (2) low energy, (3) large area uniform and parallel beam, (4) atomic beam being used to align both surfaces (col. 3 lines 25-40).

Claims 9, 11-13, 37, 41 and 43 are rejected under 35 U.S.C. 103(a) as being unpatentable over Oh et al. (US6665036B2) in view of Kim et al. (US006111627A), Hiroshi (US5995186A), Callegari et al. (US6061114A) and Masaaki et al. (JP08-101390).

In regard to claims 9 and 37, Oh et al. teach (Fig. 3A-B) a multi-domain liquid crystal display comprising

- a bottom substrate 210 having a first surface;
- a transparent conductive layer (data electrodes 208 and common electrode 209, thin film transistors and other display circuitry in bottom

Art Unit: 2871

substrate to form the in-plane switching mode) disposed over said first surface of said bottom substrate.

- a top substrate 211 having a second surface;
- a color filter layer (color filter 229) disposed over a surface of the top substrate;
- a transparent conductive layer 118 disposed over said color filter;
- a first alignment layer 223a over said first transparent conductive layer
- a second alignment layer 223b made of over said second surface; said second alignment layer being spaced adjacent to and facing said first alignment layer;
- a liquid crystal material 230 disposed in the space therebetween;

wherein

However, Oh et al. fail to disclose

(a) a second transparent conductive layer disposed over the color filter;

(b) a plurality of uniformly sized spacer 108 distributing within said space;

(c) the alignment layers made of the dry deposited layers, which are made of material selected from the group consisting of hydrogenated diamond-like carbon, amorphous hydrogenated silicon, silicon carbide (SiC), silicon dioxide (SiO₂), glass, silicon nitride (Si₃N₄), alumina (Al₂O₃), cerium(IV) oxide (CeO₂), tin oxide (SnO₂), zinc titanate (ZnTiO₂) and a combination thereof;

(d) each of said first alignment layer and said second alignment layer made of the dry deposited layers is divided into a plurality of pixels each having a boundary and at least two domains; wherein each of said multi-domain, dry

Art Unit: 2871

deposited layers is obtained by a mechanical mask; said dry deposited layers are exposed to at least a first particle (ion) beam treatment and a second particle (ion) beam treatment, where a first particle beam and a second particle beam use the same ion, which is selected from the group consisting argon, nitrogen, oxygen and a mixture thereof; and a direction (one fashion) of said first particle beam treatment with respect to said dry deposited layer is different than a direction (another fashion) of said second particle beam treatment with respect to said dry deposited layer as claims 11, 41 and 43.

Kim et al. teach (Fig.4)

(a) a second transparent conductive layer disposed over the color filter, which is formed on the surface of upper substrate; this second transparent conductive layer used for preventing electrostatics forming on the upper substrate (col. 3 lines 1-3). Kim also discloses the alignment layers 44 and 28.

Hiroshi teaches (Fig. 5)

(b) a plurality of uniformly sized spacer 108 distributing within said space for supporting the thickness of liquid crystal layer (col. 5 lines 25-29).

Callegari et al. teach

(c) the alignment layers made of the dry deposited layers, which are made of material selected from the group consisting of hydrogenated diamond-like carbon, amorphous hydrogenated silicon, silicon carbide (SiC), silicon dioxide (SiO₂), glass, silicon nitride (Si₃N₄), alumina (Al₂O₃), cerium(IV) oxide (CeO₂), tin

Art Unit: 2871

oxide (SnO_2), zinc titanate (ZnTiO_2) and a combination thereof for requiring fewer steps and less cost to manufacture (col. 3 lines 51-58).

Masaaki et al. (JP08-101390) teach

(d) each of said first alignment layer and said second alignment layer made of the dry deposited layers is divided into a plurality of pixels each having a boundary and at least two domains; wherein each of said multi-domain, deposited layer is obtained by a mask; said dry deposited layers are exposed to at least a first particle (ion) beam and a second particle (ion) beam; and a direction of said first particle beam treatment with respect to said deposited layer is different than a direction of said second particle beam treatment with respect to said deposited layer with the features of claim 11, 41 and 43 for excellent visual angle characteristic and capable of making high-grade display (abstract).

Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to further modify a multi-domain liquid crystal display as Oh et al. disclosed with (a) a second transparent conductive layer disposed over the color filter, which is formed on the surface of upper substrate; this second transparent conductive layer used for preventing electrostatics forming on the upper substrate (col. 3 lines 1-3) as taught by Kim et al.; (b) a plurality of uniformly sized spacer 108 distributing within said space for supporting the thickness of liquid crystal layer (col. 5 lines 25-29) as taught by Hiroshi; (c) the alignment layers made of the dry deposited layers, which are

Art Unit: 2871

made of material selected from the group consisting of hydrogenated diamond-like carbon, amorphous hydrogenated silicon, silicon carbide (SiC), silicon dioxide (SiO₂), glass, silicon nitride (Si₃N₄), alumina (Al₂O₃), cerium(IV) oxide (CeO₂), tin oxide (SnO₂), zinc titanate (ZnTiO₂) and a combination thereof for requiring fewer steps and less cost to manufacture (col. 3 lines 51-58) as Callegari et al. taught; (d) each of said first alignment layer and said second alignment layer made of the deposited layers is divided into a plurality of pixels each having a boundary and at least two domains; wherein each of said multi-domain, deposited layers is obtained by a mask; said deposited layers are exposed to at least a first particle (ion) beam and a second particle (ion) beam; and a direction of said first particle beam treatment with respect to said dry deposited layer is different than a direction of said second particle treatment beam with the features of claim 11 and 41-44 for excellent visual angle characteristic and capable of making high-grade display (abstract) as **Masaaki et al. taught.**

Claims 40-44 are rejected under 35 U.S.C. 103(a) as being unpatentable over Oh et al. (US6665036B2) in view of Kim et al. (US006111627A), Hiroshi (US5995186A), and Callegari et al. (US6061114A) as applied to claims 9, 11-13, 37 and 40 in further view of Chaudhari et al. (US6124914A).

Oh et al. (US6665036B2) fail to disclose said first particle beam treatment aligns first and second ones of the domains of at least one of said pixels in a first

Art Unit: 2871

direction, and wherein said second particle beam treatment aligns said first domain in a second direction as cited in claims 40-44.

Chaudhari et al. disclose the particle beam treatment overwrites said first direction of said first domain with said second direction (col. 5 lines 2-26 and 58-63), wherein the first particle beam treatment aligns first and second ones of the domains of at least one of said pixels in a first direction, and second particle beam treatment aligns said first domain in a second direction; with mechanical mask, Fig. 9A-B shows the first particle beam treatment aligns the alignment layer in one direction of surface 84 and the second particle beam treatment aligns said first domain in a second direction of surface 82 for patterning alignment direction on an alignment surface from more than one direction.

Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to further modify a multi-domain liquid crystal display as Oh et al. disclosed with the particle beam treatment overwrites said first direction of said first domain with said second direction (col. 5 lines 2-26 and 58-63), wherein the first particle beam treatment aligns first and second ones of the domains of at least one of said pixels in a first direction, and second particle beam treatment aligns said first domain in a second direction; with mechanical mask, Fig. 9A-B shows the first particle beam treatment aligns the alignment layer in one direction of surface 84 and the second particle beam

Art Unit: 2871

treatment aligns said first domain in a second direction of surface 82 for patterning alignment direction on an alignment surface from more than one direction (col. 3 lines 12-15) as Chaudhari et al. taught.

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.
